

Low Fidelity Prototype

I decided to follow design patterns I’ve seen in most shopping carts for online stores. The right panel would be a summary that stays in the same position on the screen even when scrolling. There would be an option on the cart page to add more items to the order and details of each product would be listed as well. Once the user is content with their order, they can click to continue onto payment.

Low Fidelity Prototype

I added a “Continue Shopping” button to give the user multiple options to continue adding more items to their order. I added an input for the user to put in their zipcode to calculate tax / store pickup. I also added the option to change the quantity of an item (since some of them are multipacks) within the cart instead of having to individually add more of the same item.
